Continuation of 11. does NOT place the application in condition for allowance because: Applicant's arguments filed 3/14/2008 have been fully considered but they are not persuasive.

Applicant argues that Sakamoto and Shima fail to disclose causing the host to determine if a current print data corresponds to the print job ID, and to, when the current data corresponds to the job ID, halt transmission of the print data for the print job, attach the job end command to the current print job data, and transmit the job end command to the printer.

In reply examiner asserts, Sakamoto teaches a printing cancellation unit which cancels the print job during printing operation in response to the printing cancellation request made by the user on the operational panel of the printer. At this point a request is sent to the host to halt the further transmission of the print data related to the said cancelled print job. It is apparent and well-known in the art that each print job has an print ID associated with it, plus, the cancellation instruction also includes the print ID of the print job and that the computer or host be notified that printing of the particular print job has been cancelled by the instruction from the operation panel. This therefore, causes the (apparent) the host to check if the cancellation request with print job ID received from the printer corresponde to the current print job data being supplied to the printer, and accordingly halt the further transmission of the print data from host to the printer. Note that control code is searched in the printing data to determine the mark in the data at which cancellation request was made, and then d mark attached to job data is then transmitted to the printer as an initialization request to the printer (see figures 2-3 & 13-14, and column 3, lines 15-45, column 4, lines 35-63, column 10, lines 1-16-40, column 9, lines 17-63, column 10, lines 1-644).
